**Heat transfer is a discipline of thermal engineering that concerns the generation, use, conversion, and exchange of thermal energy between physical systems. Heat transfer is classified into various mechanisms, such as thermal conduction, thermal convection, thermal radiation, and transfer of energy by phase changes. Engineers also consider the transfer of mass of differing chemical species ...**

Heat transfer is an engineering discipline that concerns the generation, use, conversion, and exchange of heat (thermal energy) between physical systems. In power engineering it determines key parameters and materials of heat exchangers. Heat transfer is usually classified into various mechanisms, such as: Heat Conduction.

Download the Excel spreadsheet templates in this article to make preliminary heat exchanger design calculations. These templates use S.I. units and U.S. units. Calculate the required heat transfer area based on values needed. They will also calculate the number of tubes needed for a shell and tube heat exchanger and to calculate the pipe length needed for a double pipe heat exchanger.

heat transfer to other properties (either mechanical, thermal, or geometrical). The answer to this is rooted in experiment, but it can be motivated by considering heat flow along a "bar" between two heat reservoirs at  $T_A$ ,  $T_B$  as shown in Figure 2.1. It is plausible that the heat transfer rate  $Q$ , is a

Types of Heat Exchangers - Classification of Heat Exchangers. Heat exchangers are typically classified according to flow arrangement and type of construction. The simplest heat exchanger is one for which the hot and cold fluids move in the same or opposite directions. This heat exchanger consists of two concentric pipes of different diameters.

again by letting heat to flow down the temperature gradient to the ambient). In Thermodynamics, sometimes one refers to heat in an isothermal process, but this is a formal limit for small gradients and large periods. Here, in Heat Transfer, the interest is not in heat flow,  $Q$ , but on heat-flow-rate,  $Q = d. Q /d. t$
